

Worksheet 9

Student Name: Raj Verma

Branch: CSE

Semester: 5th

Subject Name: ADBMS

UID: 23BCS12244

Section/Group: KRG 3-A

Date of Performance: 30/10/2025

Subject Code: 23CSP-333

1. Aim: To understand and implement the setup of Amazon Relational Database Service (AWS RDS) by creating a database instance, configuring security groups, and establishing a secure connection between the local pgAdmin tool and the RDS instance hosted on the AWS Cloud.

2. Objective:

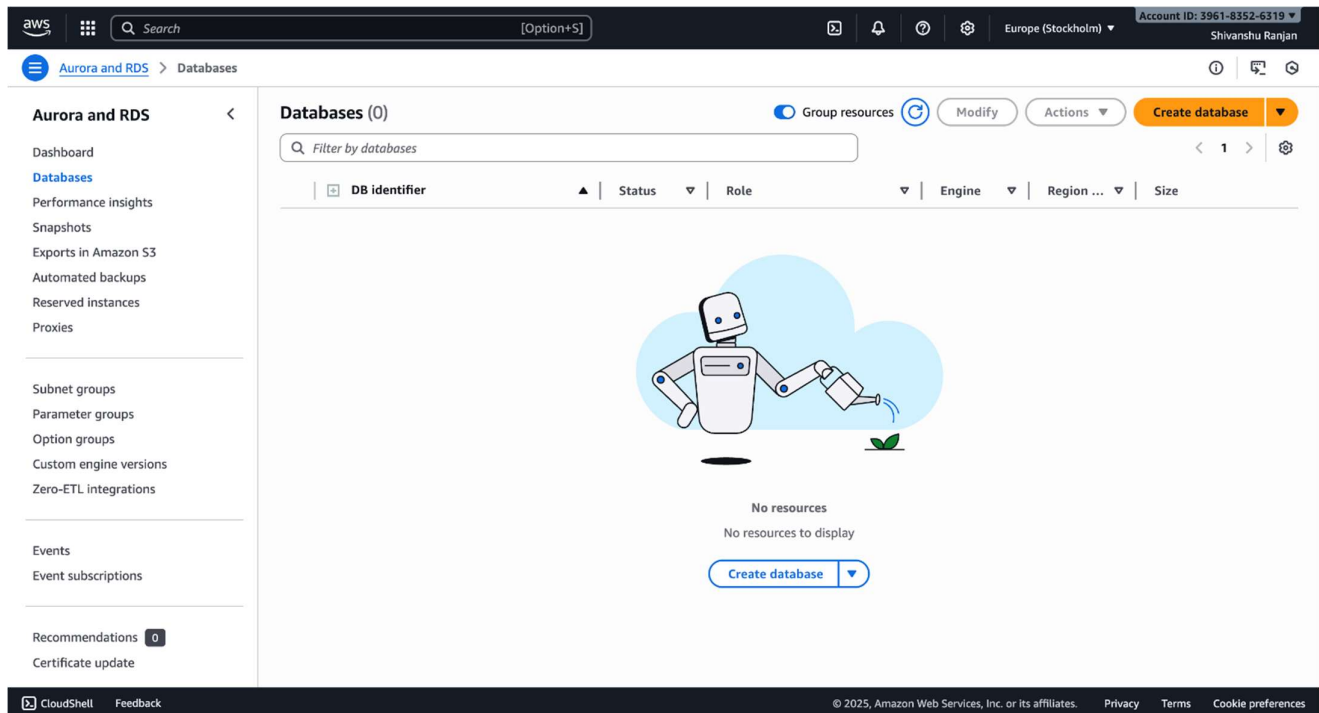

- To learn the basic concepts and features of Amazon Relational Database Service (AWS RDS).
- To create and configure a new RDS database instance on the AWS Management Console.
- To understand the role and configuration of security groups for controlling database access.
- To connect a local pgAdmin client to the AWS RDS instance securely using proper credentials and endpoint details.
- To verify successful database connectivity and perform basic operations through pgAdmin.

3. Code & Output:

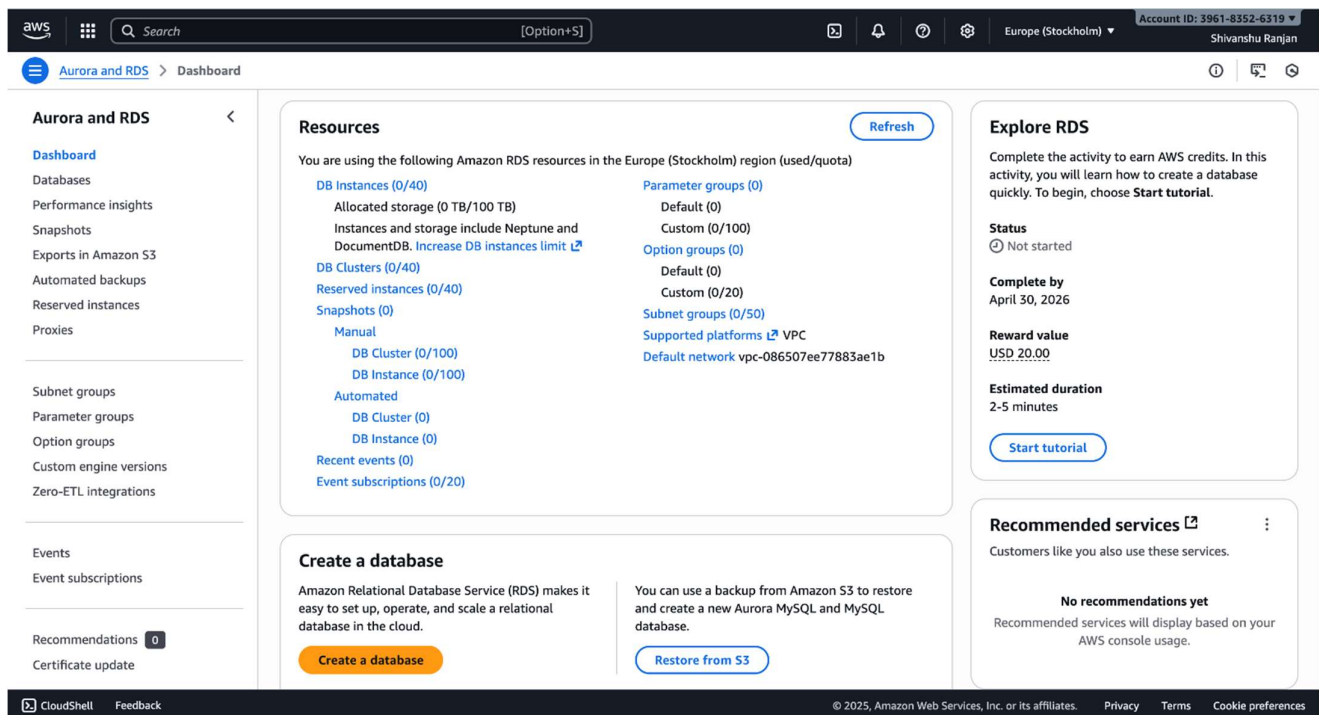

1. Sign-in

2. Navigating to RDS Service

3. Amazon RDS Dashboard Overview

4. Creating a New Database Instance

Create database Info

Free plan has access to limited features and resources
The free plan limits the features and resources that are available for RDS and Aurora databases. Upgrade your account plan to remove all limitations. [Learn more](#)

Upgrade plan

Choose a database creation method

☐ Standard create
You set all of the configuration options, including ones for availability, security, backups, and maintenance.

☒ Easy create
Use recommended best-practice configurations. Some configuration options can be changed after the database is created.

Configuration

Engine type Info

☐ Aurora (MySQL Compatible)

☐ Aurora (PostgreSQL Compatible)

☐ MySQL

☒ PostgreSQL

☐ MariaDB

☐ Oracle

5. Selecting PostgreSQL as Database Engine

DB instance identifier

Type a name for your DB instance. The name must be unique across all DB instances owned by your AWS account in the current AWS Region.

shivanshu-DB

The DB instance identifier is case-insensitive, but is stored as all lowercase (as in "mydbinstance"). Constraints: 1 to 63 alphanumeric characters or hyphens. First character must be a letter. Can't contain two consecutive hyphens. Can't end with a hyphen.

Master username Info

Type a login ID for the master user of your DB instance.

postgres

1 to 16 alphanumeric characters. The first character must be a letter.

Credentials management

You can use AWS Secrets Manager or manage your master user credentials.

☐ Managed in AWS Secrets Manager - *most secure*
RDS generates a password for you and manages it throughout its lifecycle using AWS Secrets Manager.

☒ Self managed
Create your own password or have RDS create a password that you manage.

☐ Auto generate password
Amazon RDS can generate a password for you, or you can specify your own password.

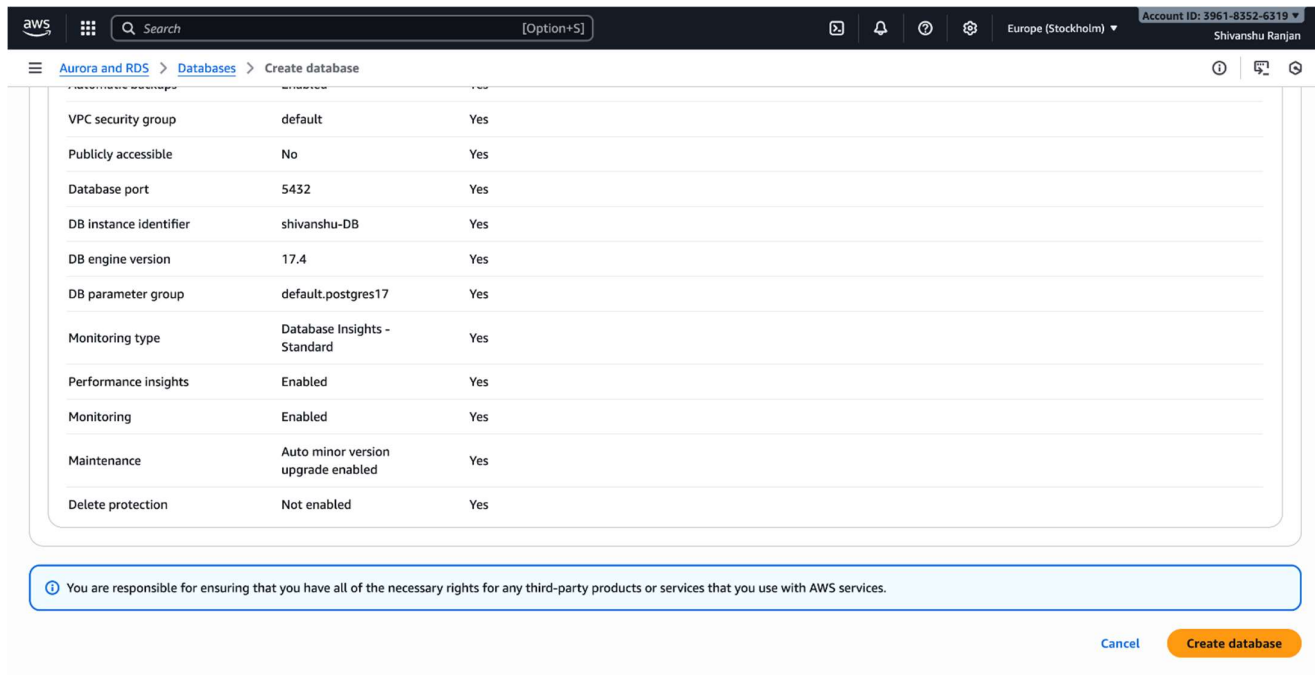

Master password Info

Password strength Neutral

Minimum constraints: At least 8 printable ASCII characters. Can't contain any of the following symbols: / ' * @

Confirm master password Info

6. Choosing Deployment Option and Template

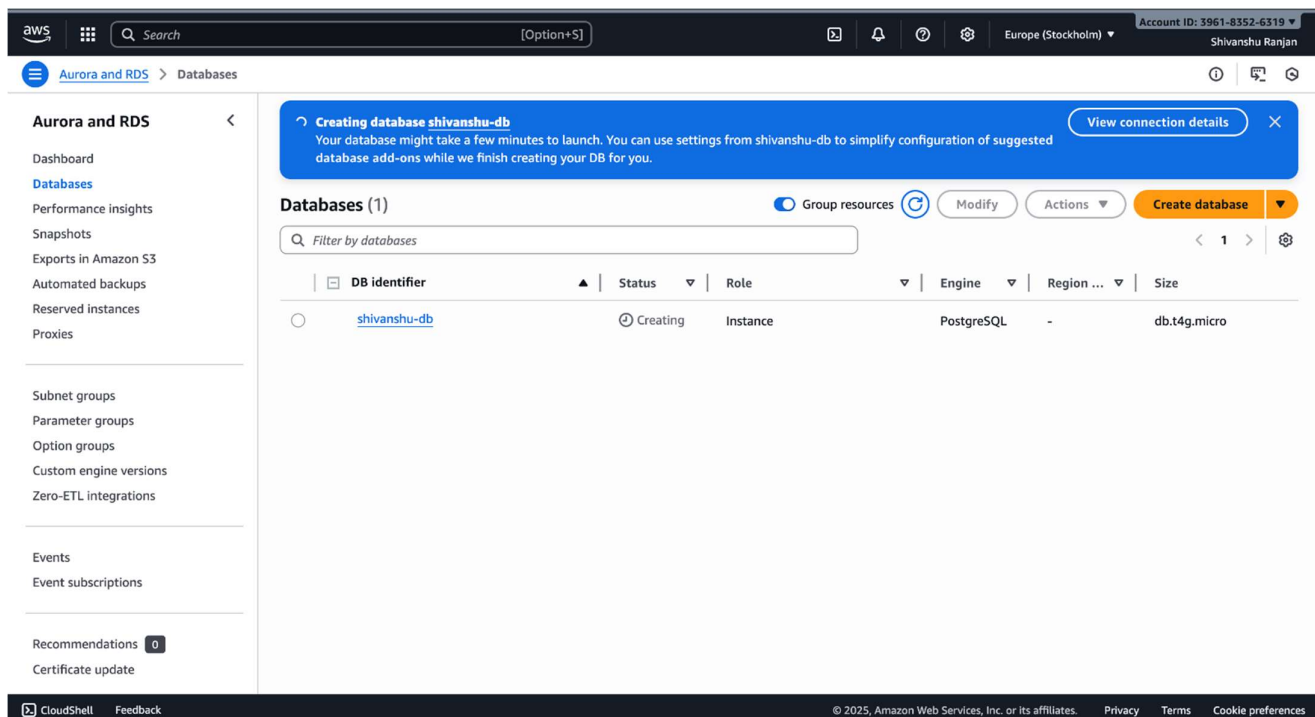

The screenshot shows the 'Create database' page in the AWS Management Console. The page displays a table of configuration options for the database instance. At the bottom, there is a warning message and two buttons: 'Cancel' and 'Create database'.

Configuration Option	Value	Required
VPC security group	default	Yes
Publicly accessible	No	Yes
Database port	5432	Yes
DB instance identifier	shivanshu-DB	Yes
DB engine version	17.4	Yes
DB parameter group	default.postgres17	Yes
Monitoring type	Database Insights - Standard	Yes
Performance insights	Enabled	Yes
Monitoring	Enabled	Yes
Maintenance	Auto minor version upgrade enabled	Yes
Delete protection	Not enabled	Yes

Warning: You are responsible for ensuring that you have all of the necessary rights for any third-party products or services that you use with AWS services.

[Cancel](#) [Create database](#)

7. Configuring Database Settings (Name, Username, Password)

The screenshot shows the 'Databases' page in the AWS Management Console. A blue banner at the top indicates that the database 'shivanshu-db' is being created. Below the banner, there is a table listing the database instances. The table has columns for DB identifier, Status, Role, Engine, Region, and Size. The database 'shivanshu-db' is currently in the 'Creating' state.

Creating database shivanshu-db
Your database might take a few minutes to launch. You can use settings from shivanshu-db to simplify configuration of suggested database add-ons while we finish creating your DB for you. [View connection details](#)

8. Setting Up Instance Size and Storage

9. Configuring Connectivity and VPC Settings

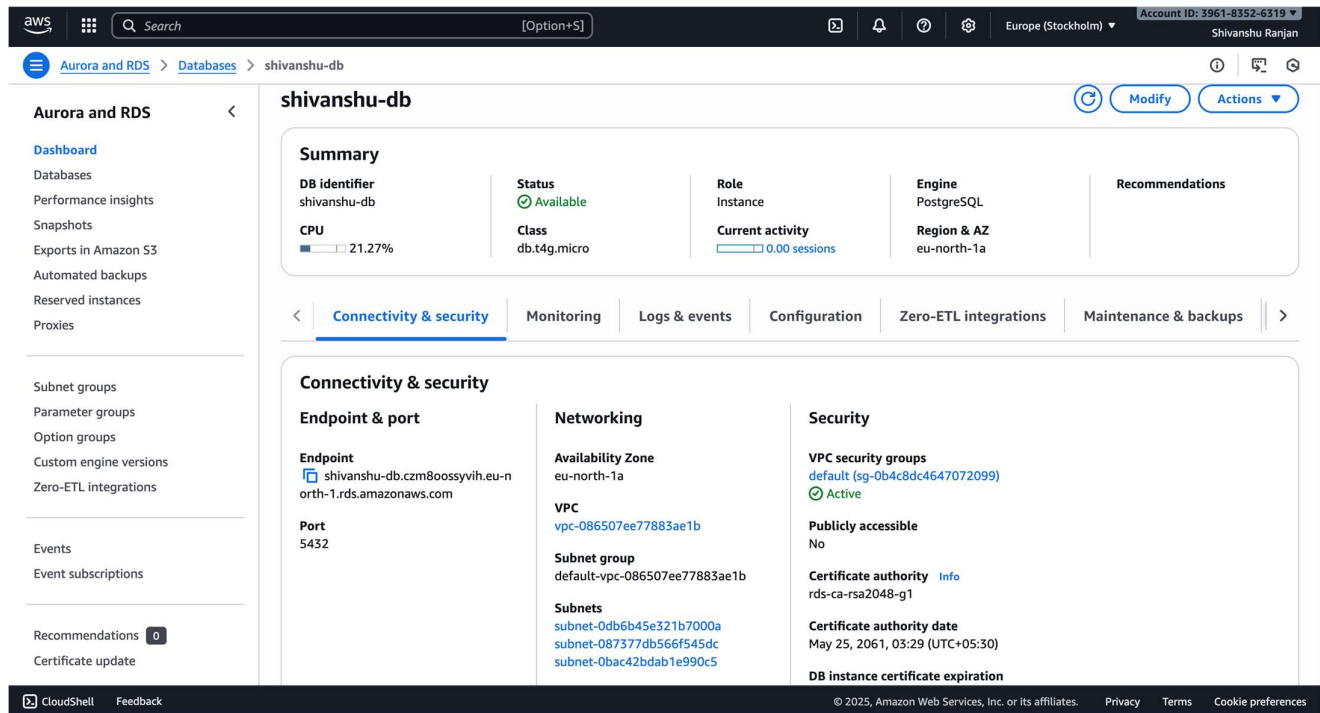

10. Gr Setting Up Security Groups for RDS Access

11. Additional Database Configuration Options

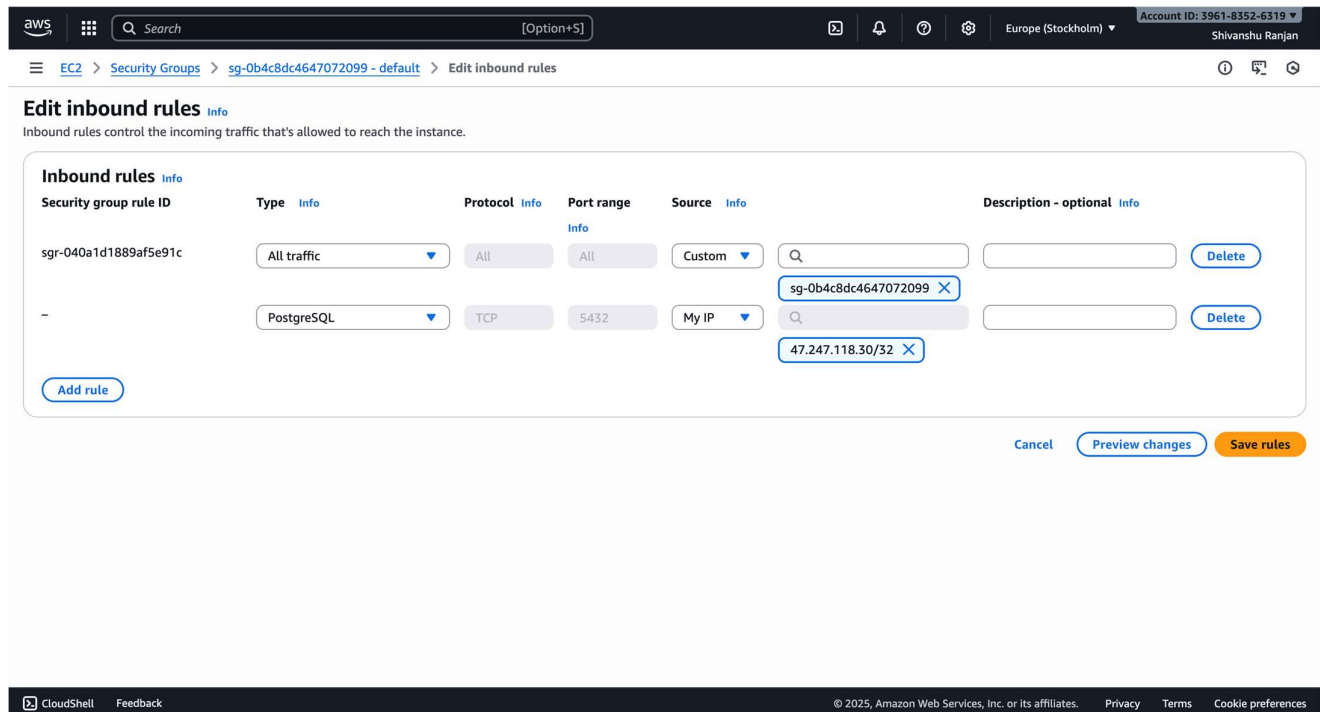

12. Reviewing and Creating the Database Instance

The screenshot shows the AWS Management Console interface for an Amazon RDS instance named 'shivanshu-db'. The left sidebar contains navigation links for Aurora and RDS, Databases, and various database management tasks. The main content area displays the instance details under the 'Summary' tab, including the DB identifier, status (Available), role (Instance), engine (PostgreSQL), and region (eu-north-1a). The 'Connectivity & security' tab is selected, showing the endpoint, port, availability zone, VPC, and security groups. The 'Security' section shows the VPC security groups and the publicly accessible status.

13. RDS Instance Creation in Progress

The screenshot shows the AWS Management Console interface for editing inbound rules for a security group. The left sidebar contains navigation links for EC2, Security Groups, and the specific security group. The main content area displays the 'Edit inbound rules' page, which includes a table of existing rules and an 'Add rule' button. The table has columns for Security group rule ID, Type, Protocol, Port range, Source, and Description. The 'Add rule' button is highlighted, and the 'Preview changes' button is visible at the bottom right.

14. Viewing Database Instance Details

▼ Additional configuration

Public access

☒ Publicly accessible

RDS assigns a public IP address to the database. Amazon EC2 instances and other resources outside of the VPC can connect to your database. Resources inside the VPC can also connect to the database. Choose one or more VPC security groups that specify which resources can connect to the database.

☐ Not publicly accessible

No IP address is assigned to the DB instance. EC2 instances and devices outside the VPC can't connect.

Database port

Specify the TCP/IP port that the DB instance will use for application connections. The application connection string must specify the port number. The DB security group and your firewall must allow connections to the port. [Learn more](#)

5432

15. Copying the RDS Endpoint for Connection

16. Launching pgAdmin on Local Machine

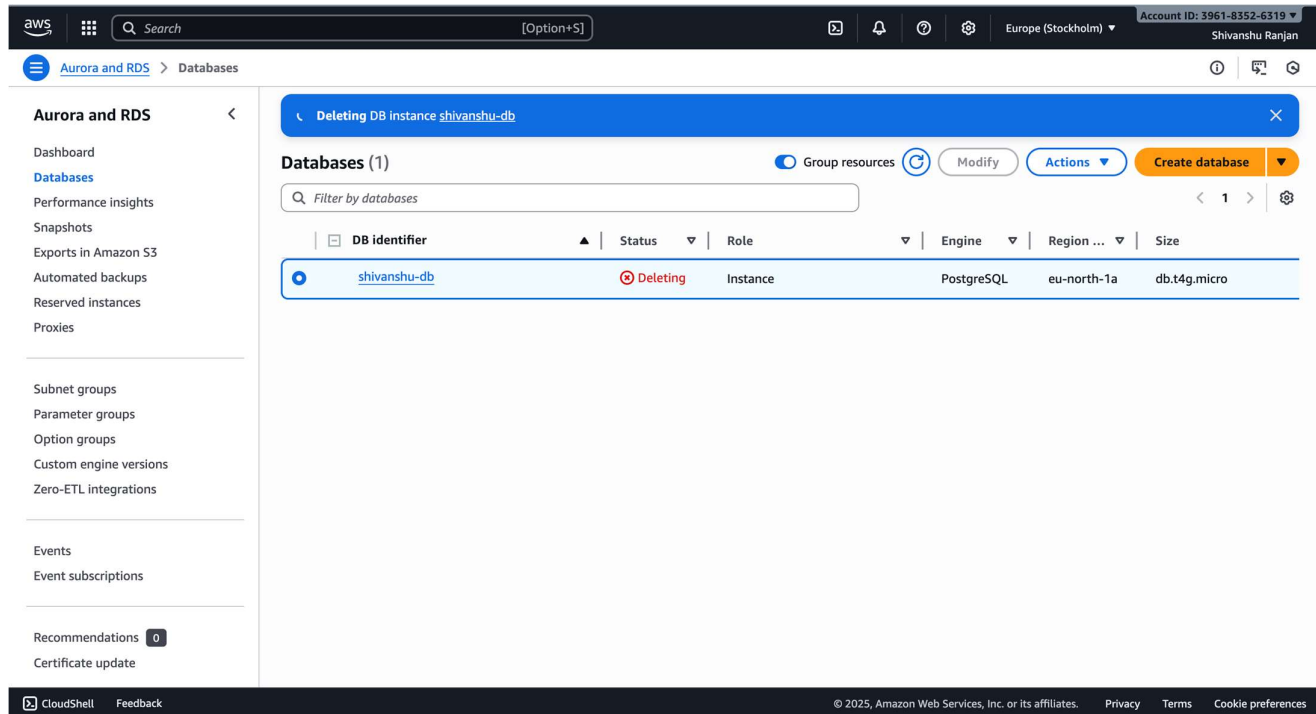

17. Adding a New Server in pgAdmin

18. Entering Connection Details (Endpoint, Username, Password)

19. Successful Connection to AWS RDS Database via pgAdmin

The screenshot displays the AWS Management Console interface. At the top, the navigation bar shows the AWS logo, a search bar, and the account ID: 3961-8352-6319. The main content area is titled 'Aurora and RDS' and 'Databases'. A blue banner at the top of the main area indicates 'Deleting DB instance shivanshu-db'. Below this, the 'Databases (1)' section shows a table with one entry: 'shivanshu-db'. The table columns are 'DB identifier', 'Status', 'Role', 'Engine', 'Region ...', and 'Size'. The 'Status' column for 'shivanshu-db' shows a red 'Deleting' status. The 'Engine' is 'PostgreSQL', the 'Region' is 'eu-north-1a', and the 'Size' is 'db.t4g.micro'. The left sidebar contains a navigation menu with options like 'Dashboard', 'Databases', 'Performance insights', 'Snapshots', 'Exports in Amazon S3', 'Automated backups', 'Reserved instances', 'Proxies', 'Subnet groups', 'Parameter groups', 'Option groups', 'Custom engine versions', 'Zero-ETL integrations', 'Events', 'Event subscriptions', 'Recommendations', and 'Certificate update'.

4. Learning Outcomes:

- Understand the fundamental concepts and benefits of using Amazon RDS for relational database management in the cloud.
- Gain practical knowledge of creating and configuring an RDS database instance on AWS.
- Learn how to manage and secure database access using AWS security groups.
- Develop skills to connect a local pgAdmin client to a cloud-hosted RDS instance.
- Be able to monitor, manage, and test database connectivity and performance in a cloud environment.
